We have calculated the imaginary part of W and Z gauge boson's wave-function renormalization constants (wrc.) in the complex-pole mass renormalization scheme and made atonement for the paper hep-ph/0301090 where the imaginary part of gauge boson's wrc. has been ignored in the second renormalization scheme in section 4. But the conclusion of this section in hep-ph/0301090 doesn't change.

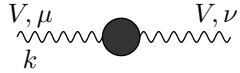
In the complex-pole mass renormalization scheme [1], the gauge boson's wave-function renormalization constant (wrc.) shoul be complex number. If the gauge boson's self-energy function is writen as [2]



$$= -i(g_{\mu\nu} - \frac{k_\mu k_\nu}{k^2})\Sigma^T_{VV}(k^2) - i\frac{k_\mu k_\nu}{k^2}\Sigma^L_{VV}(k^2) \tag{1}$$

then in the complex-pole mass renormalization scheme the form of the gauge boson's propagator in resonant region should be

$$\frac{1}{p^2 - M_0^2 + \Sigma^T_{VV}(p^2)} \sim \frac{1}{m^2 - M_0^2 + \Sigma^T_{VV}(m^2) + (p^2 - m^2)(1 + \Sigma^{T\prime}_{VV}(m^2))} = \frac{(1 + \Sigma^{T\prime}_{VV}(m^2))^{-1}}{p^2 - m^2 + B} \tag{2}$$

with $B = (m^2 - M_0^2 + \Sigma^T_{VV}(m^2))/(1 + \Sigma^{T\prime}_{VV}(m^2))$ Thus we obtain the gauge boson's wrc.

$$Z = (1 + \Sigma^{T\prime}_{VV}(m^2))^{-1} \xrightarrow{one-loop} 1 - \frac{\partial}{\partial p^2}\Sigma^T_{VV}(m^2) \tag{3}$$

In figure 1 we show the W gauge boson's self-energy diagrams which have contribution to the ξ_W-dependent imaginary part of W gauge boson's wrc..

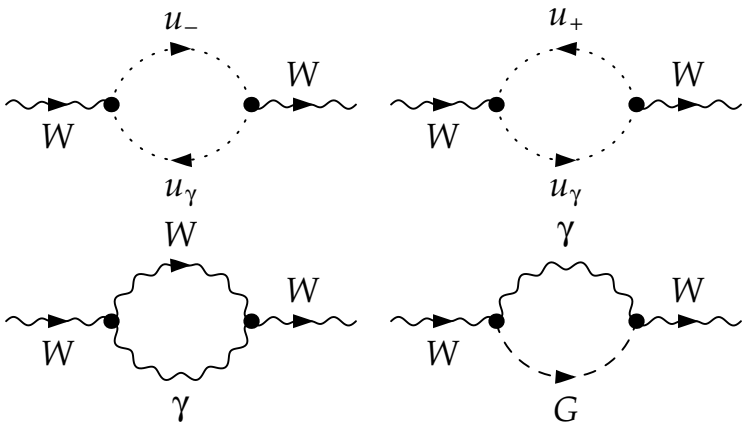


FIG. 1. W boson's self-energy diagrams which have contribution to the ξ_W-dependent imaginary part of W boson's wrc..

Based on Eq.(1),(3) and the *cutting rules* [3], we have

$$Im[Z_W] = -\frac{e^2(1 - \xi_W)(\xi_W^2 - 2\xi_W - 11)\theta[1 - \xi_W]}{96\pi} \tag{4}$$

In figure 2 we show the Z gauge boson's self-energy diagrams which have contribution to the ξ_W-dependent imaginary part of Z gauge boson's wrc..

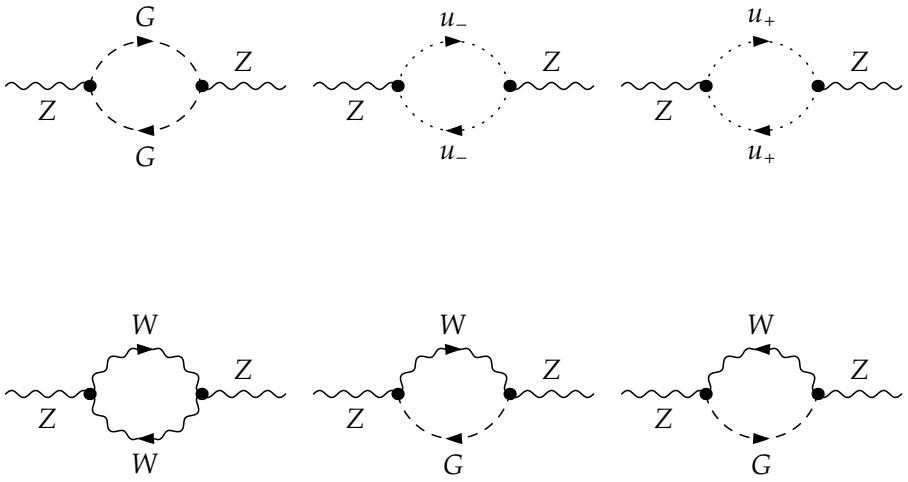

FIG. 2. Z boson's self-energy diagrams which have contribution to the ξ_W-dependent imaginary part of Z boson's wrc..

Based on Eq.(1),(3) and *cutting rules*, we also have

$$\begin{aligned} Im[Z_Z] \;=\; & -\tfrac{1}{96\pi c_W^2 s_W^2} e^2 (1-4c_W^2\xi_W)^{3/2}\theta[1-4c_W^2\xi_W] \\ & +\tfrac{1}{48\pi c_W^2} e^2((\xi_W-1)^2c_W^4-2(\xi_W-5)c_W^2+1)\sqrt{(\xi_W-1)^2c_W^4-2(\xi_W+1)c_W^2+1}\,\theta[1/c_W-\sqrt{\xi_W}-1] \end{aligned} \tag{5}$$

Such imaginary part of gauge boson's wrc. will contribute to the amplitudes of physical processes, e.g. $W^- \to e_i\bar{\nu}_i$ and $Z \to d_i\bar{d}_i$. These two processes have been calculated in section 4 of hep-ph/0301090, but the imaginary part of gauge boson's wrc. has been ignored in the complex-pole mass renormalization scheme. So Eq.(57)-(60) of hep-ph/0301090 need to be modified. Eq.(58) and (60) should be gotten rid of. Eq.(57) about the imaginary part of the amplitude of $W^- \to e_i\bar{\nu}_i$ in complex-pole mass renormalization scheme should be changed as follows

$$Im[T_1'] \;=\; A_L\frac{e^3(1-\xi_W)^3\theta[1-\xi_W]}{64\sqrt{2}\pi s_W} + B_L\frac{e^3(\xi_W-1)^3 m_{l,i}M_W\theta[1-\xi_W]}{32\sqrt{2}\pi s_W(M_W^2-m_{l,i}^2)} \tag{6}$$

It is also a gauge-dependent quantity. For the process $Z \to d_i\bar{d}_i$, Eq.(59) is only the result of the on-shell mass renormalization scheme. In the complex-pole scheme, the right result is

$$\begin{aligned} Im[\mathcal{M}(Z\to d_i\bar{d}_i)]_{m_{d,i}\to 0} \;=\; & A_L[-\tfrac{1}{576\pi c_W^3 s_W}e^3(1-4c_W^2\xi_W)^{3/2}\theta[1-4c_W^2\xi_W] \\ & +\tfrac{1}{288\pi c_W^3}e^3 s_W((\xi_W-1)^2c_W^4-2(\xi_W-5)c_W^2+1) \\ & \times\sqrt{(\xi_W-1)^2c_W^4-2(\xi_W+1)c_W^2+1}\,\theta[1/c_W-\sqrt{\xi_W}-1]] \\ & +A_R[-\tfrac{1}{576\pi c_W^3 s_W}e^3(1-4c_W^2\xi_W)^{3/2}\theta[1-4c_W^2\xi_W] \\ & +\tfrac{1}{288\pi c_W^3}e^3 s_W((\xi_W-1)^2c_W^4-2(\xi_W-5)c_W^2+1) \\ & \times\sqrt{(\xi_W-1)^2c_W^4-2(\xi_W+1)c_W^2+1}\,\theta[1/c_W-\sqrt{\xi_W}-1]] \end{aligned} \tag{7}$$

where $A_L = \bar{d}_i\not{\epsilon}\gamma_L d_i, A_R = \bar{d}_i\not{\epsilon}\gamma_R d_i$. It is also gauge-dependent. At one-loop level all of these gauge-dependent terms cannot contribute to the modulus square of the physical amplitude. But we haven't still known how to cancel out the contributions of these gauge-dependent terms to the modulus square of the physical amplitude at two loop level. It needs to be done in the future.

Thus the conclusion of section 4 of hep-ph/0301090 is still alive. That's: based on the present knowledge we cannot judge which scheme is the better, on-shell mass renormalization shceme or complex-pole mass renormalization shceme.
